

## Using UAVs to Solve Water Stress Issues in Precision Agriculture

---

Haly Neely, Cristine Morgan, Nithya Rajan, Gregory Rouze, Yeyin Shi, Alex Thomasson, and John Valasek

# Managing Resources

---

Challenges for agriculture:

- Less land
- Soil erosion/degradation
- Fertilizer costs/supply
- Less water

$$G \times E \times M = \text{Yield}$$

# Soil Variability

---

© 2015 Google

# Soil Water = Yield Potential

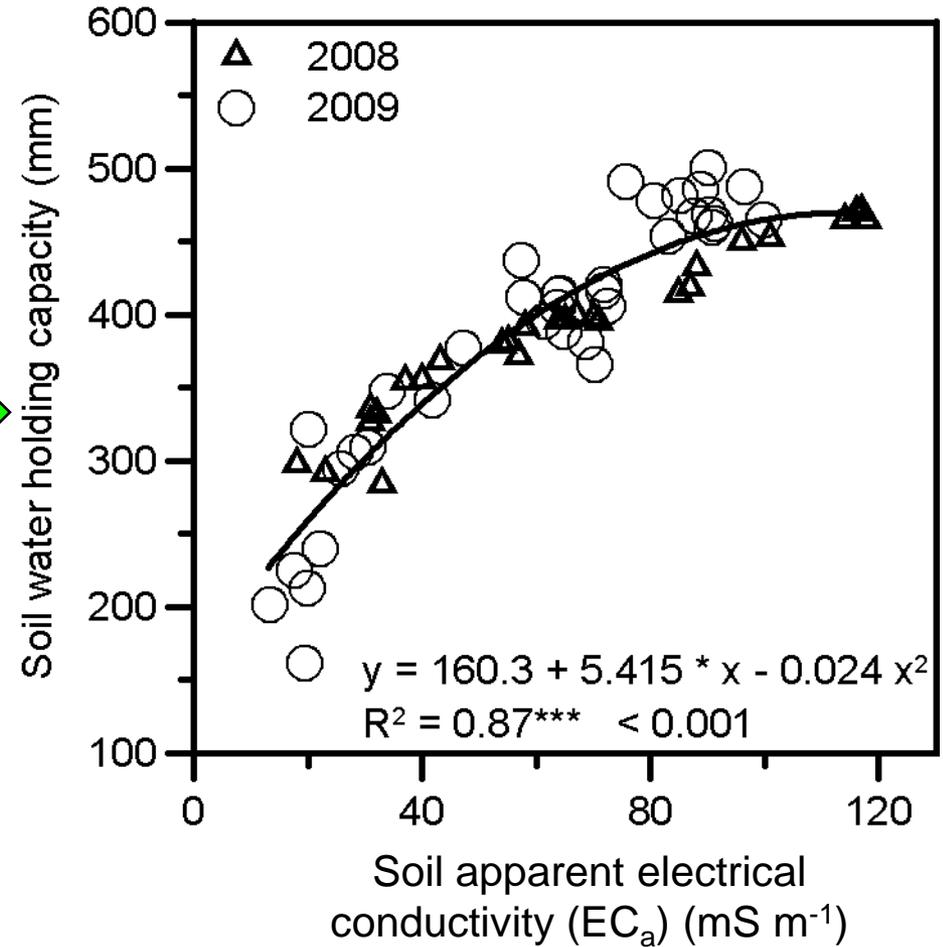

September 2007 – Sandy loam

July 2007 – Silty clay loam

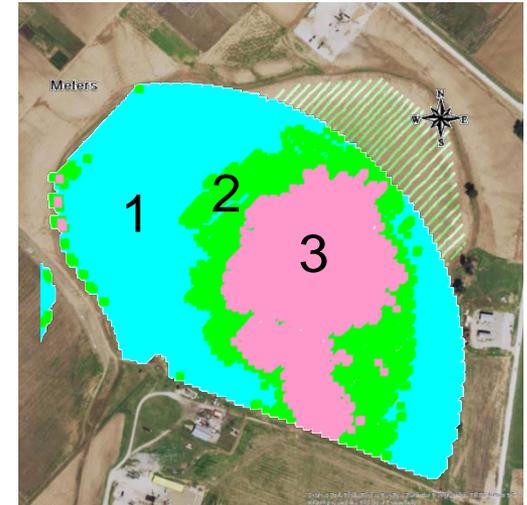

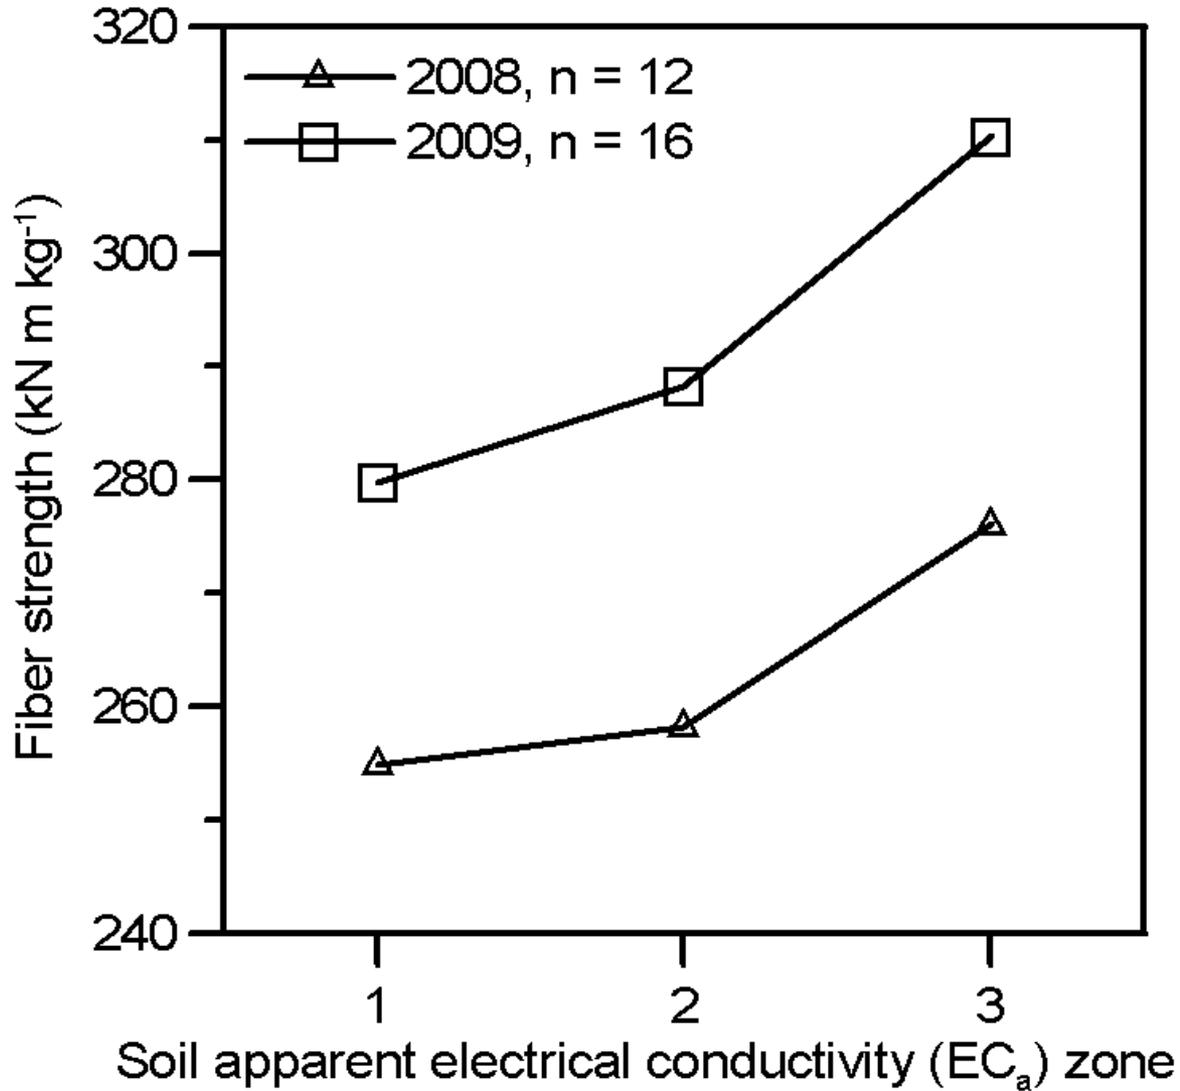

# Proximal Soil Information

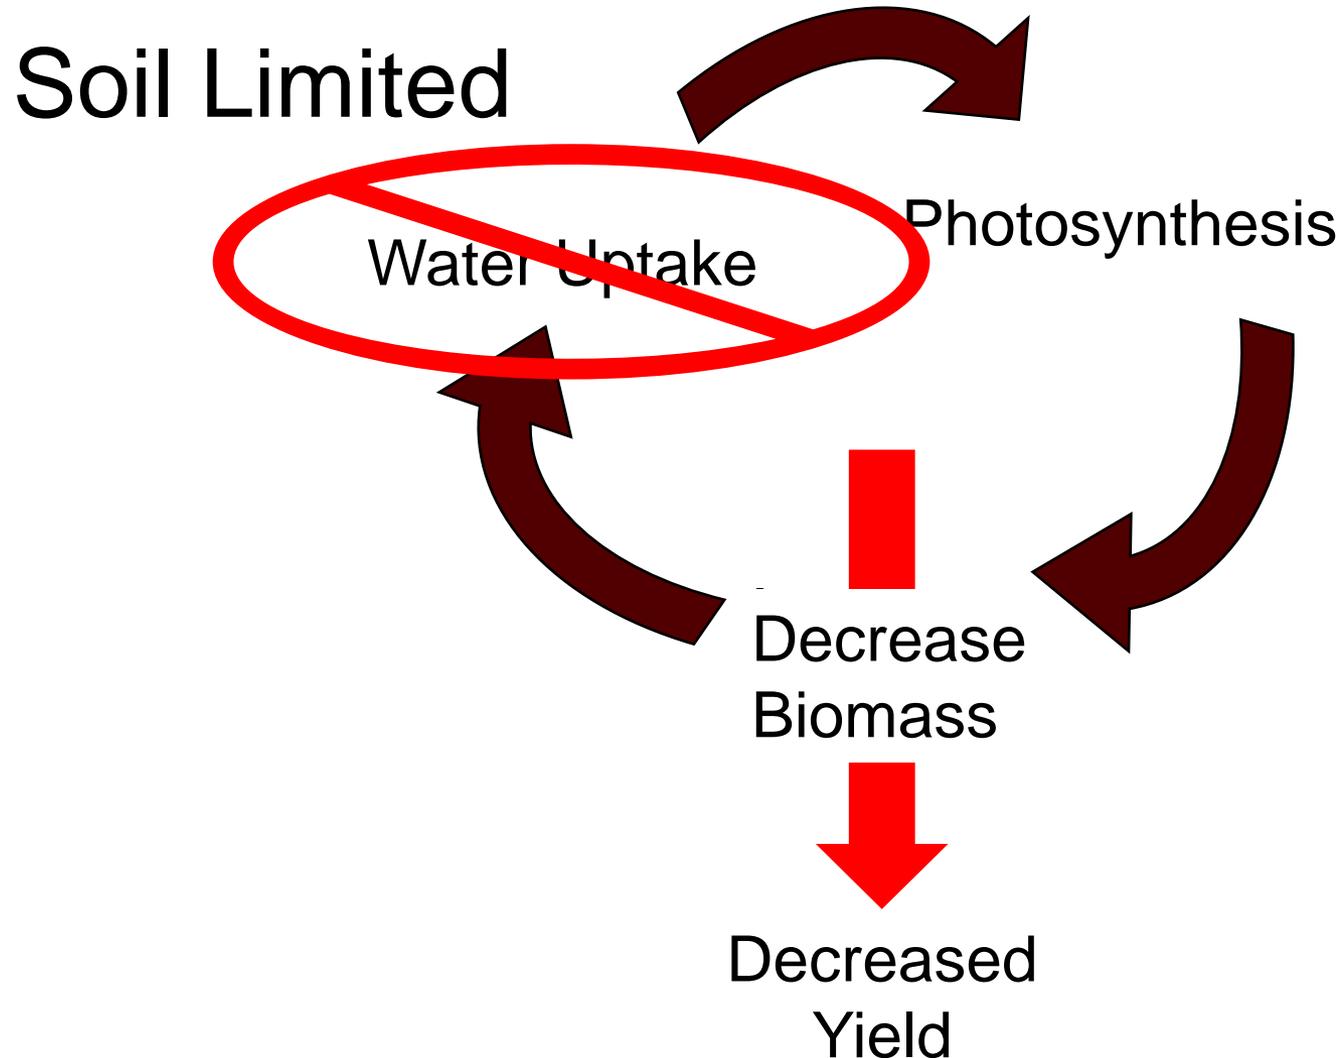

**Soil Water =  $EC_a$**

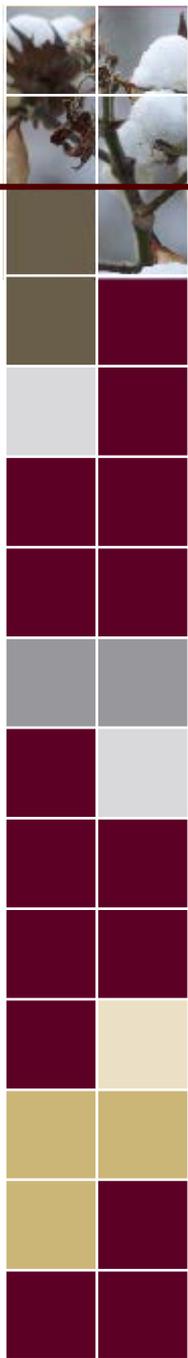

# Results: Lint Quality (Strength)

# When adding more water is not an option

---

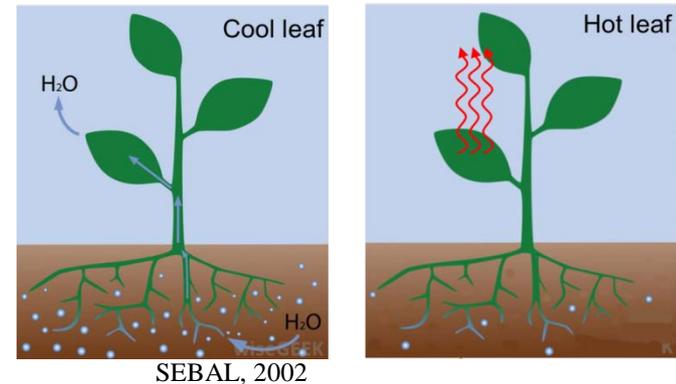

# 2016 Project Objectives

---

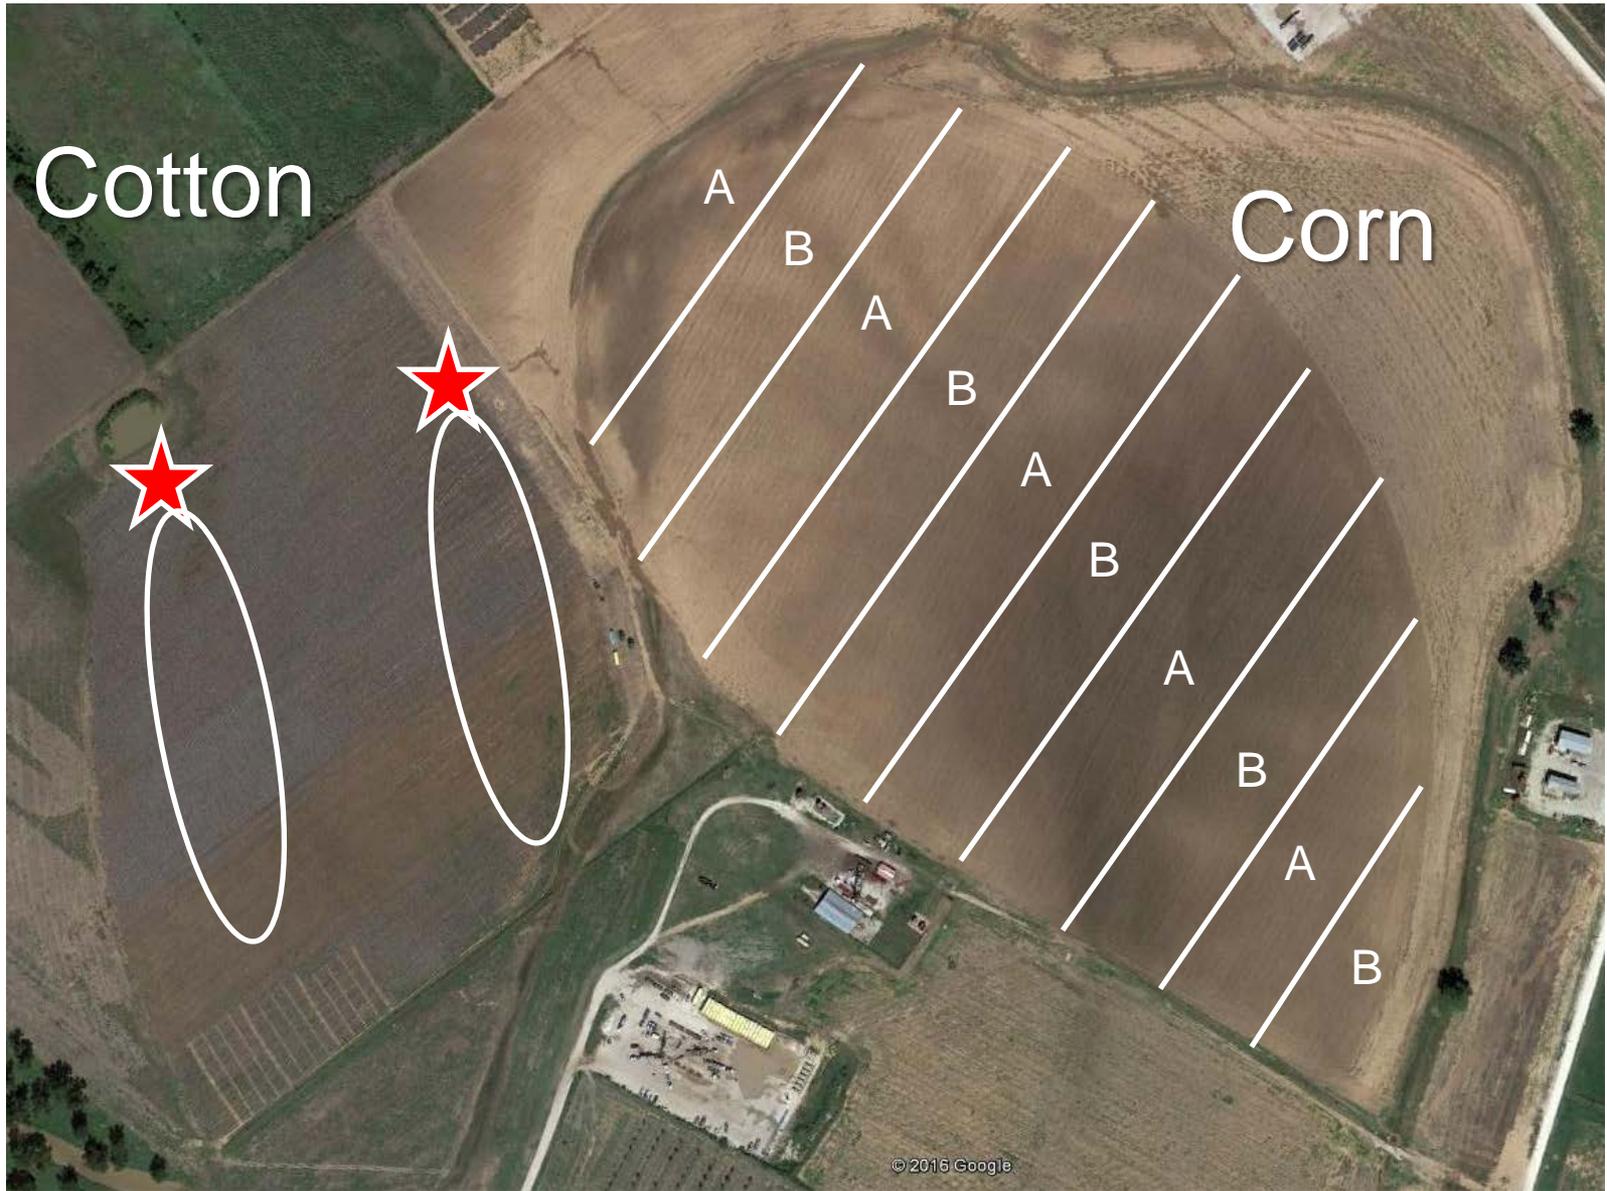

1. Map stress between and within corn varieties with visNIR and thermal UAS-based sensing
2. Estimate transpiration in cotton using thermal imagery, and validate with sensible-latent heat flux data
3. Evaluate how differences in soil properties affect uncertainty of UAS-based plant sensing

# What We Know

- Canopy temperature is a good indicator of crop stress
- Soils will influence crop stress
- Must balance the energy budget
  - Differences in temperature not enough
  - Energy in = energy out

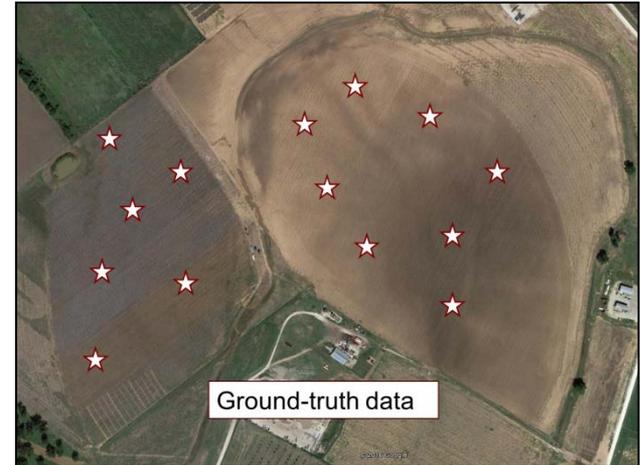

$$R_{abs} - L_{oe} - H - \lambda E = 0$$
$$R_{abs} - \epsilon_s \sigma T_L^4 - c_p g_{Ha} (T_L - T_a) - \lambda g_v \frac{e_s(T_L) - e_a}{p_a} = 0$$

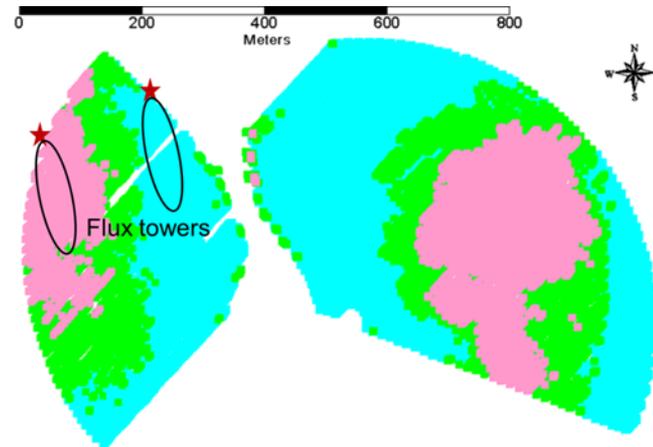

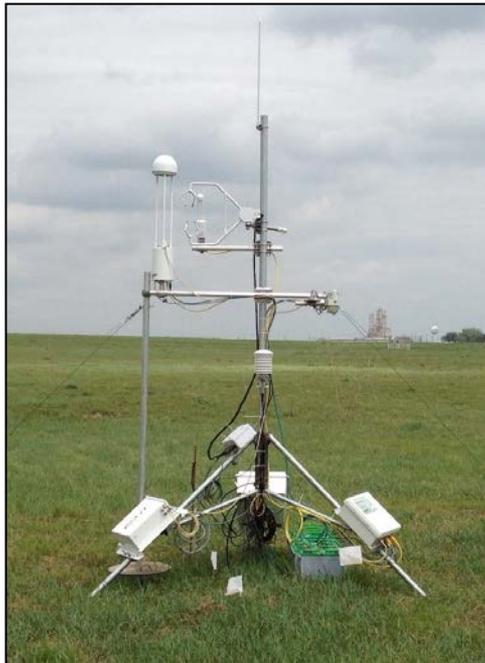

# Ground-truth Data

- Soil moisture
  - Neutron moisture meter
- Canopy temperature
  - IRT, at time of flight
- NDVI
- Leaf area index
- Plant height
  - Other basic crop notes

# Eddy Covariance Systems

- Collaboration with Dr. Bill Kustas (USDA Beltsville, Maryland)
- Soil-specific fluxes of latent and sensible heat
- 2 towers

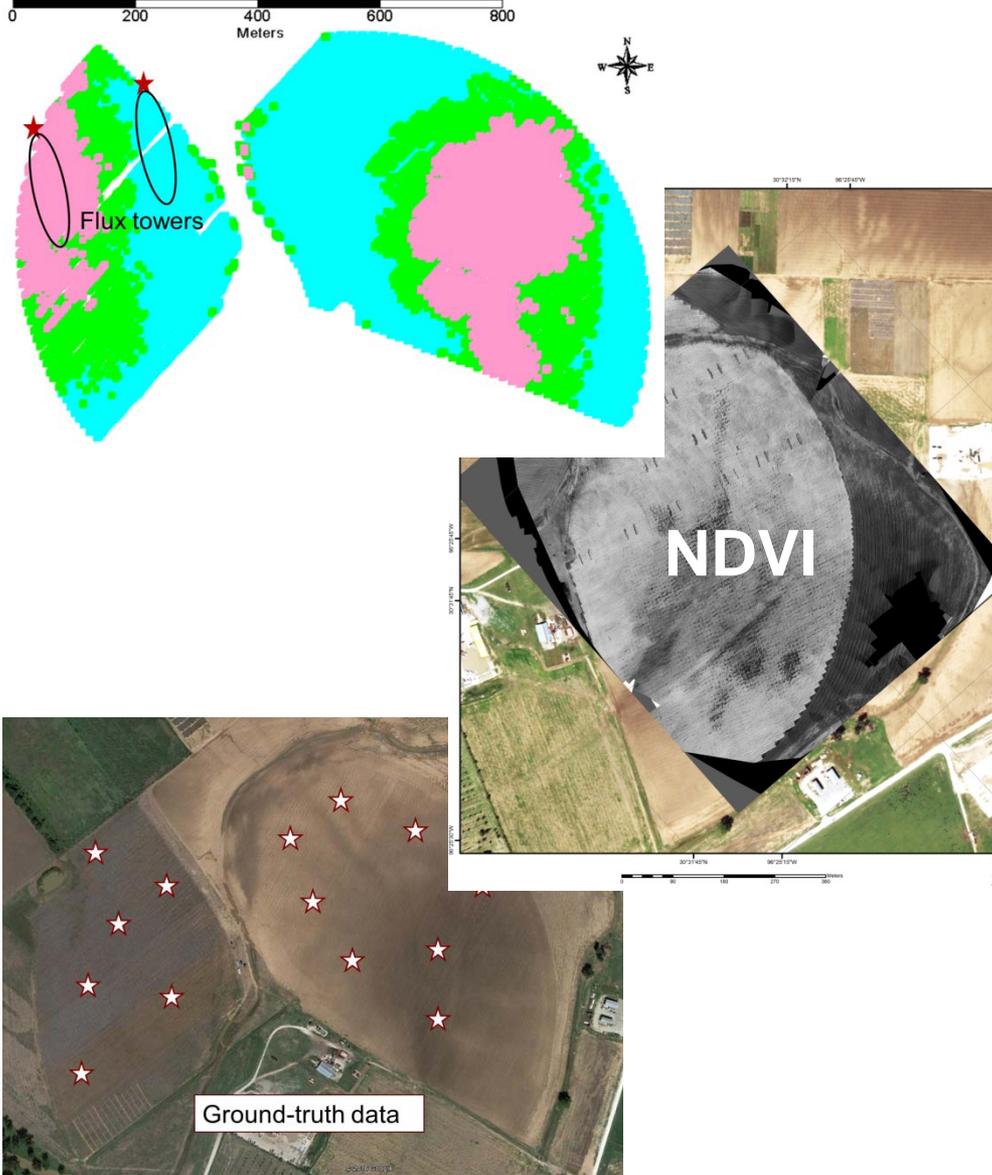

# UAV Data

- Anaconda fixed-wing UAV
- Imaging sensors
  - DSLR
  - Multi-spectral
  - Thermal
- Need targets, calibration

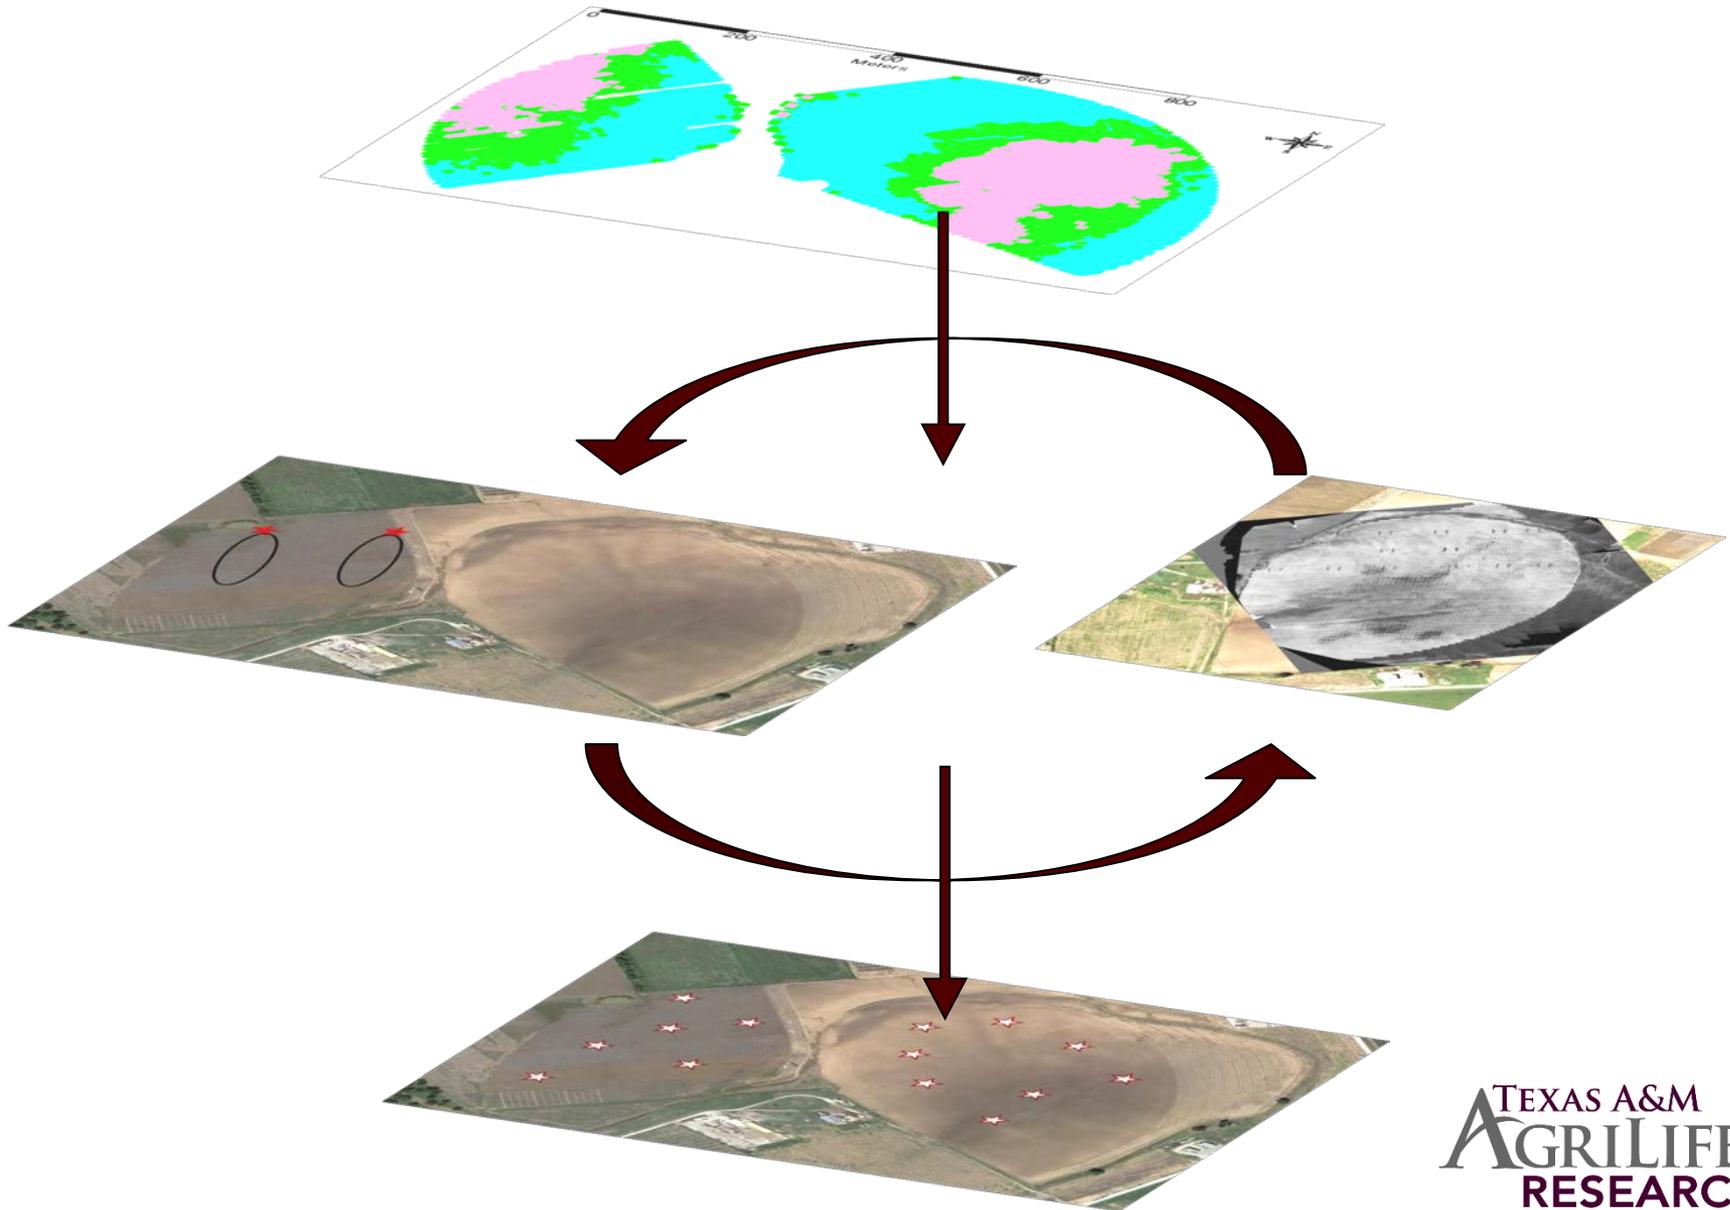

# Data Layers

- Soils information
  - Fine spatial
- Flux information
  - Coarse spatial
  - Fine temporal
- Canopy temperature
  - Fine spatial
  - Coarse temporal
- Ground truth data
  - Coarse spatial
  - Coarse temporal

# Data Fusion

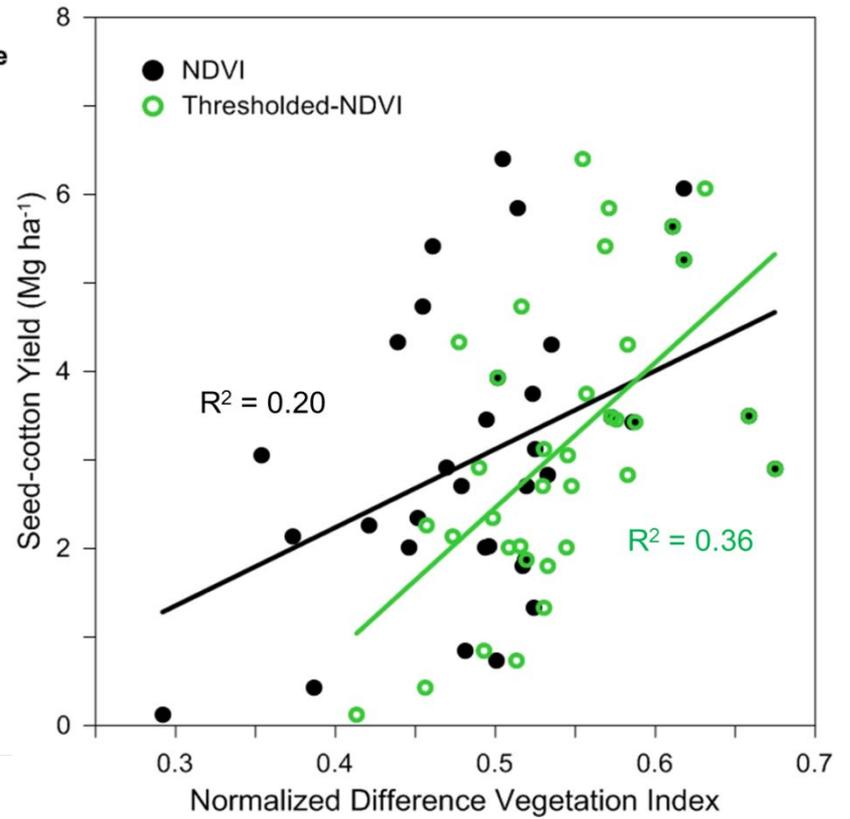

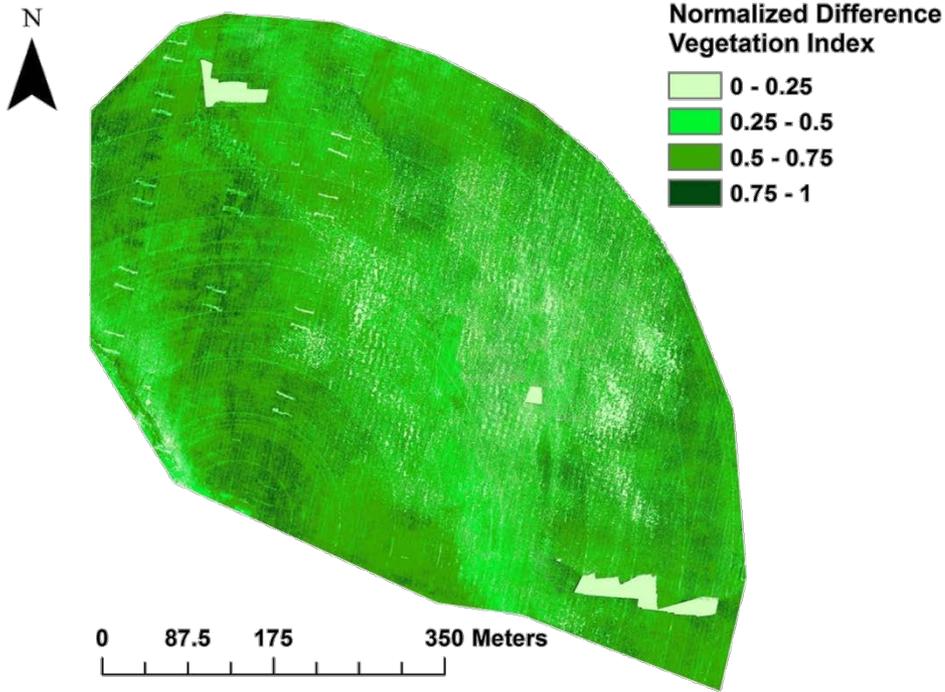

# Questions We Can Answer:

---

- Threshold of detectable stress between and within varieties
- New techniques for using soil information for site-specific genetics
- Track plant water use strategies
- Use this information to recommend efficient irrigation management
- Develop protocols for use by plant breeders and agronomists

Questions ?

$$\text{NDVI} = \frac{\text{NIR} - \text{Red}}{\text{NIR} + \text{Red}}$$

# Challenges 1

Variable sunlight and cloud conditions strongly affect image quality

FAA mandated Line of Sight (LOS) operations and altitude restrictions negatively impact operational efficiency and data quality
